Orig Pub : Jozna mech. a opt., 1956, 1, No 4, 138-139

Abstract : The statement that the values of the check marks remain unchanged during the measurement of the peak focal distances is refuted, and it is shown that it depends on the reciprocal of the intrinsic magnification. As indicated it is essential to modify the dioptrimeter for quantitative estimates. Examples of certain practical applications are given.

Inst : Not given  
Title : Anisotropy and Refraction of Spectacle Glass.

Orig Pub : Jozna Mech. a opt., 1957, 2, No 2, 60-62

Abstract : The author considers the causes of disagreement between the numerical value of the anisotropy  $A$  and the value of the real peak refraction  $A'_{\infty}$  of the eyeglass correcting the anisotropy at a certain distance  $\delta$  between the rear peak and the forward peak of the cornea. The greater  $\delta$ , the greater the difference between  $A$  and  $A'_{\infty}$ . A method is indicated for finding the value of  $A'_{\infty}$  from given values of  $A$  and  $\delta$ . A method is proposed for designating astigmatic eyeglasses, differing from the customary method.

Title : Eyeglasses for Close Vision in Aphakia.

Orig Pub : Jemna mekh. e opt., 1957, 2, No 4, 120-122

Abstract : It is noted that the existing rules for prescribing eyeglasses for close vision, are based on the assumption that the proscribed glass is thin and that its thickness can be neglected, cannot be used for aphakia glasses, since, as a rule, the correction of the eye for close vision requires the use of positive eyeglasses of considerable refraction. It is shown that for eyes with aphakia it is necessary to have eyeglasses for close vision with a refraction which on the average is 1.0 diopter greater than usual.

**Determination of the Hardness of Rails using a 10-mm. Ball.**  
T. Lyashchenko and A. Klaus. (Met., 1937, No. 8, pp. 85 (6)). (In Russian). Some theoretical considerations and a large mass of experimental results, given in graphical form, show that a hardness determination using a 10-mm. ball and load of 4,000 kg. gives a more reliable calculated value of the tensile strength than that deduced from the hardness measured with a 10-mm. ball and a load of 3,000 kg. Neither of the two calculated values for the tensile strength can, however, be regarded as a substitute for the result of a direct determination.

<p>Preparation of the Materials Used in Blast-Furnace Operation. A. Klava... (Banyassati es Kohassati Lapok, 1950, vol. 5, Feb.-Mar., pp. 184-193). [In Hungarian]. The methods of preparing the ore, coke and lime, and the treatment of the blast for blast-furnaces are reviewed. Air drying is recommended to obtain more uniform operation. The author also recommends use of oxygen-enriched blast in Hungary and briefly describes the various methods of ore preparation. In Dicsgyor a tunnel furnace of the Grondal type has been built for preparation of 'red alines' according to a Hungarian method developed by Vismayovsky and Bejna; pulverised ore is mixed with this material during the process. In the discussion B. Vecsei gave results of experiments on Hungarian spathic iron ore and pisolitic bauxite, the object of which was to recover the barium in these ores. By using an extremely fine screen about half of the barium could be recovered as a fine powder containing about 90% barium. A combination of this method with magnetising roasting is likely to prove successful.</p>

5592. A RARE CASE OF NEUROBLASTOMA WITH AN ENORMOUS INTRA-CRANIAL METASTASIS IN AN ADULT WOMAN - Neobvyklý případ neuroblastomu s obrovskou intrakraniální metastasou u dospělé ženy - Klaus F. and Koleček A. Neurol. Klin. Lek. Fak., Palackého Univ., Olomouc - ACTA UNIV. PALACK. OLOMUCENSIS 1957, 13 (167-176) illus. 2

A case of neuroblastoma with multiple metastases in the cranial vault of a 24-year-old woman is reported. One of the tumour masses was tremendous and behaved like a rapidly growing extracerebral tumour. The first metastasis was probably a solitary one in the tibia, appearing 5 yr. before the general spread of the tumour. The final diagnosis was made histologically from the mass extirpated. Before death, a lesion of the cauda equina and the conus medullaris was prominent in the clinical picture, indicating a primary localization of the tumour in the gastric or pelvic sympathetic nerve.

In 8 cases with clinically marked paraparesis, non-characteristic X-ray findings were observed in 5 cases. In one case of epiduritis, at the level Th 5-6, the finding was even negative. An operation in 4 cases showed an improvement of the condition. Novotný - Brno (VIII, 9, 14, 15\*)

1840. FACIAL SPASM IN BASILAR IMPRESSION - Spasmus facialis bei basaler  
Impression - Klaus E. and Bohuněk V. Neurol. Klin., Palacky Univ.,  
Olomouc - DTSCH. Z. NERVENHEILK. 1958, 177/4 (318-326) illus. 2  
A basilar impression was found in 3 out of 15 cases of facial spasm, while in 2  
other cases, moreover, signs of an invagination were present. The mechanical-  
irritative moment of distortion of the facial nerve and reflex alterations of blood  
supply and CSF circulation are believed to be the pathogenic factors. Decompensa-  
tion of the cerebrum is suspected as a cause of the clinical manifestation in elderly  
persons. The surgical success in a similar case of Barraquer-Bordas is mention-  
ed.

"Premedication with Neuroleptics and Analgesics in Cerebral Arteriography."

Prague, Československá Neurologie, Vol 29, No 5, Sep 66, pp 357 - 360

Abstract [Authors' English summary ]: Application of neuroleptics and analgesics in cerebral arteriography was investigated experimentally in the neurosurgical department of the University Hospital at Olomouc. The results of treatment of 68 patients show that arteriography with premedication combined with local filtration anesthesia of the site of the arterial puncture on the neck is better than the usual methods of either local anesthesia only or of general anesthesia. 6 Western, 1 Czech reference.

"The Question of Supplying Vitamin in the Form of Ascorbic Acid  
to Soldiers."

Prague, Vojenske Zdravotnicke Listy, Vol 35, No 4, Aug 66, pp  
158 - 162

Abstract [Authors' English summary modified]: Soldiers suffered  
from a large seasonal deficiency of vitamin C in the part of  
the army in which an investigation was made. 100 mg per day was  
administered daily for a period of 3 months to a group of soldiers;  
this group had a serum level of 0.5 mg% against 0.21-0.29 mg %  
found in the control group. In a group which received 600 mg of  
ascorbic acid once a week for 3 weeks the level was kept at 0.7  
mg%. Such rapid administration should be made only when the nor-  
mal supply (100 mg daily) cannot be administered. 3 Figures, 3  
Tables, 4 Western, 10 Czech, 4 Russian, 1 Egyptian reference.

"Isotope Placentography."

Prague, Casopis Lekaru Ceskych, Vol 105, No 19, 13 May 66, Lekarska Veda v Zahranici, No 5, pp 89 - 93

Abstract: Iodine  $^{131}$  is the best suited isotope for the purpose. It is bound with human serum albumin, and the thyroid gland of the foetus is protected from this iodine by the administration of inorganic iodine, which blocks it before  $I^{131}$  is administered. Good results are also obtained with human serum albumin tagged with  $Cr^{51}$ , or with erythrocytes tagged with  $Cr^{51}$ . Cr has the advantage that it is not accumulated by a particular human organ. Scintillation counters are used in the determination of the amounts of the isotope. The method is safer than mechanical examination. 2 Figures, 2 Tables, 50 Western, 4 Czech references.

Klaude W. Obtaining Lecithin from Rape-Seed Oil and Rape Seeds.

Obtynienie lecytyny z oleju rzepakowego i z nasion rzepaku\*  
(Prace GL Inz. Przem. Roln. i Społ. No. 3) Warszawa. 1952. PWT.  
14.5 pp., 7 tabs.

Polish Technical Abst.  
No. 1 1954  
Chemistry and Chemical Technology

Lecithin was isolated from raw rape-seed oil and rape seeds in addition to rape seeds, various oils were used for the investigations, such as commercial oils and oils obtained in the laboratory. The lecithin from the rape-seed oil was obtained by the hydration method used in the Lever-Union Schicht factories. As a result of repeated experiments, raw lecithin amounting to from 1.5% to 5.8% in relation to the weight of oil was obtained (0.15%—1% of purified lecithin). The best product — distinguished by its bright colouring, ductility and maximum phosphorus content — was also the highest yields were obtained by the hydration of rape-seed oil in the laboratory. By extracting rape seeds with solvents followed by precipitation with acetone, lecithin amounting to from 1.5% to 1.8% was obtained in relation to the weight of seeds. The high-quality product was obtained by extracting with a mixture of alcohol and benzene (boiling temperature 50—60°C).

AUTHOR: Klausting, Ye. A.; Petunina, Ye. V.

TITLE: Research on structural steel with improved strength

SOURCE: Stal', no. 1. 1964, 56-60

TOPIC TAGS: structural steel, steel nitriding, steel modification, steel mechanical property, low alloy steel / steel 18G2, steel 18G2AF

ABSTRACT: The construction industry uses perlite-ferrite, readily weldable, non-heat-treated steels with a yield point of 30-25 kg/mm<sup>2</sup>. Higher yield levels cannot be achieved by alloying since this causes the formation of martensite, lower plasticity and much poorer weldability. Since low-alloy 18G2 steel can be modified and its yield point improved to 40 kg/mm<sup>2</sup> by nitriding, the authors undertook a detailed experimental study with the following results. Modification of 18G2 steel by the addition of small amounts of N (0.02%) and of nitride-forming elements (Al, V, Ti, Zn) substantially influences its mechanical properties. In the presence of aluminum, nitrides the point of cold brittleness of hot-rolled steel shifts toward lower temperatures while the strength remains unchanged. Upon normalization of such steel

TITLE: A limiter mechanism for drives and control systems

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika,  
no. 6, 1962, abstract 6-2-162 y (Czech. Patent, cl.  
21a4, 70, no. 97653, 15.12.1960)

TEXT: The object of the patent is a mechanical limiter of the number of revolutions for drives and control systems. The limiter is intended for use in those systems where Geneva-movement type mechanisms are used for analog problem solution. The limiter is of simple construction and small dimensions and thus superior to mechanisms of the above type. [Abstractor's note: Complete translation.]

TEXT: The patent covers the system of contacts and the design of a variometer consisting of a coil with a helical winding and a cylindrical part made of an electrically conductive material and provided with a screw-thread. The coil and the cylindrical part are prolongations of each other; they are placed on an electrically insulated rod and partly enclosed in an electrically insulated sleeve upon which the contacts are fixed. The device is switched into the tuning circuit either through a fixed slide contact touching the coil winding, or through a similar contact touching the cylindrical part. The flanges at the ends of the assembly coil-cylinder are provided with splines for a screw-driver, that permit regulating (both from above and below) the position of the coil with
